Vitality Home Health Services

Burjeel Holdings · AI Agent Demo

DEVELOPER BRIEF

AI Agent Demo — Developer Specification

Consolidated from 2 client questionnaire responses. Covers confirmed requirements, demo defaults for unanswered items, and all flows the demo must include.

- April 10, 2026
- 2 respondents
- Demo scope — not production spec
- Prepared by CodeOx

⚠ **How to read this document:** Items marked **TBC — Confirm with client** were left unanswered by both respondents. Sensible demo defaults are suggested and highlighted in blue. These must be validated with the Vitality team before the live presentation.

● Confirmed by client ● Conflict between responses ● Not answered — TBC ● Suggested demo default

1 Platform Overview

✓ The demo must show an AI agent handling **home healthcare coordination** — receiving patient requests via WhatsApp, assigning the nearest available therapist, sending reminders, processing documents, and escalating to human staff when required. The agent communicates in **English and Arabic**.

SERVICES COVERED IN DEMO

Physiotherapy | Nursing Care | Post-Surgical Care | Elderly / Chronic Care | Occupational Therapy | IV Drips * | At-Home Hydrofacials * | Venus Legacy (Cosmetic) * | Telemedicine *

* From Respondent 2 only. Include in service menu.

LANGUAGES

English | Arabic (عربي)

AI must auto-detect language and reply in the same language. Confirmed by both respondents.

2 Communication Channel — WhatsApp

⚠ **Conflict between responses:** Respondent 1 said they do *not* currently use WhatsApp (uses phone/SMS). Respondent 2 said they *already use WhatsApp Business*. Resolution: Build the demo around **WhatsApp Business API** — this is the more complete setup and the primary use case both respondents selected.

Primary channel	**WhatsApp Business API** — demo built entirely around WhatsApp as the patient-facing channel
Fallback / secondary	Demo default: Include voice call reminder as a secondary channel (requested by Respondent 1). Show as an optional flow.
Demo setup	Use **WhatsApp Business API sandbox** (Twilio or Meta Cloud API test environment) — no production number required

3 Use Cases — What the Demo Must Show

#	Use Case	Requested By	Priority
UC-1	Patient requests a home visit via WhatsApp	✓ Both	Must Have
UC-2	AI assigns the nearest available therapist automatically	✓ Both	Must Have
UC-3	Automated appointment reminders to patients	✓ Both	Must Have
UC-4	Processing patient-sent documents and photos	✓ Both	Must Have
UC-5	Escalation to staff — no therapist accepts after buffer window	✓ Both	Must Have
UC-6	Escalation — patient expresses urgency or emergency	✓ Both	Must Have
UC-7	Escalation — patient asks to speak to a human directly	Respondent 2	Should Have
UC-8	Escalation — AI cannot understand patient's request	Respondent 2	Should Have
UC-9	Voice call reminders to patients (phone fallback)	Respondent 1	Nice to Have

4 Primary Demo Flow — Patient Booking via WhatsApp

1 Patient Sends Message on WhatsApp

Patient messages the Vitality WhatsApp number requesting a home visit. They may type freely in English or Arabic. AI greets them and collects: service type, preferred date/time, and location.

UC-1 — confirmed by both

2 Location Identification

Respondent 1: use address from patient record. Respondent 2: show all options. Demo default: present all three — (a) saved address, (b) patient shares live location via WhatsApp, (c) patient types address manually.

Demo default: show all 3 options

3 Patient Sends Documents / Photos (if applicable)

Patient may send prescriptions, referral letters, lab results, or wound photos directly via WhatsApp before or after booking.

TBC — File types: default PDF + JPEG/PNG ***TBC — Action: acknowledge, store, notify coordinator***

4 AI Assigns Nearest Available Therapist

AI queries the dummy therapist dataset and selects the best match based on proximity and specialization.

TBC — Assignment logic: default is proximity + specialization + availability

Demo data: small dummy dataset — confirmed by both

5 Therapist Notification & Acceptance

AI notifies the assigned therapist via WhatsApp/SMS. If no response within the buffer window, AI moves to the next available therapist.

TBC — Buffer time: demo default 10 minutes

6 Booking Confirmation to Patient

AI sends a WhatsApp confirmation with therapist name, service, date/time, and visit summary. No staff involvement needed at this step.

Automated

7 Appointment Reminders

AI automatically sends reminder messages before the appointment.

TBC — Timing: demo default 24h before + 2h before ***TBC — Method: WhatsApp message (primary) + voice call (optional)***

8 Escalation to Human Staff

AI hands off to human coordinator in any of these situations:

No therapist accepts after buffer **Patient is urgent / emergency** **Patient requests a human** **AI cannot understand request**

5 Unanswered Questions — Confirm with Client Before Demo

Q4 — How do patients currently request a home visit?	*Not answered. Demo uses WhatsApp as intake. Ask: Do patients currently call the clinic, use an app, or a website?*
Q7 — How should therapists be assigned?	Demo default: nearest therapist + specialization match + availability. Confirm if gender preference, preferred therapist, or other criteria apply.
Q8 — Wait time before notifying next therapist?	Demo default: 10 minutes. Confirm preferred buffer window.
Q9 — Types of files patients might send?	Demo default: PDF (prescriptions, reports, referral letters), JPEG/PNG (wound photos, X-rays).
Q10 — What should AI do with patient files?	Demo default: (1) Acknowledge receipt to patient. (2) Attach to booking record. (3) Notify coordinator that a document is pending review.
Q11 — How far in advance should reminders be sent?	Demo default: 24 hours before + 2 hours before the appointment.
Q12 — How should reminders be sent?	Demo default: WhatsApp message (primary). Optional voice call (secondary, per Respondent 1). Confirm if SMS is also required.
Q14 — Existing HIS / scheduling system?	*Not answered. Demo uses dummy data only (confirmed by both). Ask: Is there an existing system for the production integration?*

6 Demo Data Requirements

✓ **Both respondents confirmed:** Use a small set of sample / dummy data. No real patient or therapist data should be used in the demo.

SAMPLE THERAPISTS

Create **5–8 dummy profiles**:
- Name & specialization
- Location (lat/lng — Dubai/Abu Dhabi area)
- Availability schedule
- Sandbox WhatsApp/phone number

SAMPLE PATIENTS

Create **3–5 dummy records**:
- Name & saved address
- Language preference (EN/AR)
- Sandbox WhatsApp number
- One sample past booking

SAMPLE FILES

Prepare **2–3 files** for demo:
- Dummy prescription (PDF)
- Dummy wound photo (JPEG)
- Dummy referral letter (PDF)

7 Suggested Tech Stack for Demo

Component	Suggested Option	Notes
WhatsApp Integration	Meta Cloud API or Twilio WhatsApp Sandbox	Twilio sandbox is fastest to set up for demo purposes
AI / NLP Engine	Claude API (Anthropic) or GPT-4o	For understanding messages, detecting language, generating replies
Language Detection	Handled by AI model automatically	Detect Arabic/English from incoming text; reply in same language
Backend / Orchestration	Node.js (Express) or Python (FastAPI)	Webhook receiver, booking logic, therapist assignment algorithm
Therapist Assignment	Haversine formula or Google Maps Distance Matrix	Calculate nearest therapist from patient location using dummy lat/lng
Document Processing	Store file + acknowledge patient (demo only)	Full OCR/extraction is a production feature — not required for demo
Reminders / Scheduler	node-cron or APScheduler (Python)	Trigger WhatsApp reminder messages at configured intervals
Voice Call (optional)	Twilio Voice API	For UC-9 — nice to have
Data Store (demo)	JSON file or SQLite	Keeps demo setup simple — no production database needed
Demo Dashboard (optional)	Simple web UI — live bookings, assignments, escalation log	Useful during the demo presentation to show the coordinator's view

8 Suggested Demo Script — Walkthrough Order

Scene	What to Show	Use Cases
Scene 1	Patient messages in **English**: "I need a physiotherapist at home tomorrow morning." AI collects location, date/time. Assigns nearest therapist. Therapist accepts. Booking confirmed via WhatsApp.	UC-1, UC-2
Scene 2	Same flow in **Arabic**: "أريد ممرضة في المنزل." AI auto-detects Arabic and completes the full booking in Arabic.	UC-1, UC-2 (AR)
Scene 3	Patient sends a **prescription PDF** and a **wound photo** via WhatsApp. AI acknowledges receipt and flags the coordinator.	UC-4
Scene 4	Show the **automated reminder** being sent to a patient 24 hours before their appointment.	UC-3
Scene 5	Assigned therapist does not respond within 10 minutes. AI automatically **notifies the next therapist**. After another failure, AI **escalates to staff** with booking summary.	UC-5
Scene 6	Patient types: "This is an emergency, I need someone right now." AI detects urgency keyword and **immediately escalates** to a human coordinator, sending an alert with patient details.	UC-6, UC-7
