

SOLUTION BRIEF · AUGUST 2026

SPL National Address Integration for femi9.com

A confident, evidence-based plan to solve femi9's last-mile delivery accuracy problem by integrating Saudi Post's National Address system directly into the existing Magento 2 checkout — replacing guesswork pin-drops with government-verified, 1m²-accurate addresses.

- 4 SPL REST APIs Mapped
- 1m² Address Accuracy
- Free SPL Registration

BRIEF NO. FAD-FEMI9-2026-SPL-01	DATE 10 August 2026	PLATFORM Magento 2 (WeCare-Verified)	PREPARED BY WeCare Technology
------------------------------------	------------------------	---	----------------------------------

DELIVERY CONFIDENCE

Ready to Build

All 4 SPL National Address APIs reviewed & mapped to femi9's checkout

Track Record
2 Live SPL Integrations

PREPARED FOR FAD International · femi9.com. This brief is based on direct technical review of femi9's live Magento checkout, SPL's official National Address API documentation, and splonline.com.sa — not a generic pitch.

OVERVIEW

Executive Summary

femi9 customers are experiencing missed and misdirected deliveries because the checkout's location capture — like most Magento stores — leans on Google Maps pin-dropping, which is often imprecise in newly developed or informally addressed Saudi neighborhoods. Saudi Post (SPL) solved this exact problem at a national level with the **National Address** system: every location in the Kingdom is surveyed to roughly 1 square meter of accuracy and expressed as a structured address or a memorable 8-character Short Address.

WeCare Technology has already built and shipped this integration for two other e-commerce clients — **Feed** and **Planet Zero**. This brief lays out exactly how the same proven approach applies to femi9's Magento 2 checkout, using SPL's own official API documentation and a direct technical review of femi9.com.

Prepared For FAD International femi9.com	Prepared By WeCare Technology shabeeb@wecaretech.com +966 535 716 437	Brief Details No: FAD-FEMI9-2026-SPL-01 Date: 10 August 2026 Platform: Magento 2
---	--	---

WHAT THIS BRIEF COVERS

- ✓ **Root Cause of Missed Deliveries**

Why Google Maps pin-drop is the weak link in femi9's current checkout.
- ✓ **SPL National Address Explained**

What it is, how accurate it is, and why it is government-mandated.
- ✓ **Exact Technical Integration Plan**

Mapped against femi9's live Magento checkout and SPL's 4 REST APIs.
- ✓ **Proven Track Record**

The same integration already running in production for Feed and Planet Zero.
- ✓ **Delivery Roadmap**

Phased plan from SPL business registration through to production go-live.
- ✓ **What FAD Needs to Provide**

The one dependency outside our control: the SPL business API key.

OUR COMMITMENT

WeCare Technology has already delivered SPL National Address integrations in production for Feed and Planet Zero. This is not exploratory work for us — it is a repeatable playbook we are ready to execute on femi9's Magento 2 storefront with the same rigor and reliability.

1

SECTION 1

The Problem — Why Orders Miss the Mark

We reviewed femi9.com's live checkout directly. It runs on Magento 2, and — like the overwhelming majority of Magento stores in the region — its address capture leans on Google Maps for pin-dropping and location lookup. Google Maps geocoding is built for global consistency, not for Saudi Arabia's addressing reality: many residential compounds, new districts, and informally named streets simply aren't mapped with building-level precision. The customer drops a pin that *looks* right on screen, and the courier still ends up at the wrong villa or the neighbor's gate.

WHAT THIS COSTS FEMI9

Every misdelivered order means a failed first attempt, a redelivery trip, a delayed customer, and — in fashion e-commerce, where first impressions drive repeat purchase — a real risk of return or lost trust. This is a fixable, structural problem, not a one-off logistics hiccup.

2

SECTION 2

The Solution — SPL National Address

SPL (Saudi Post) operates the Kingdom's official **National Address** system — a government-mandated addressing standard where every location has been surveyed to roughly **1 square meter of accuracy**. Each address resolves to a structured format (building number, street, district, city, postcode, additional number) and to a memorable **Short Address**: 4 letters followed by 4 digits, e.g. RRRD3005. Registration is free for individuals and businesses, and short addresses can already be looked up through SPL Online, Absher, Tawakkalna, Sehhaty, and Maha — meaning most femi9 customers in Saudi Arabia either already have one or can get one in minutes.

	CURRENT: GOOGLE MAPS PIN	WITH SPL NATIONAL ADDRESS
Accuracy	Variable — often 50–200m off in newer or informal districts	~1m ² — government-surveyed
Source of truth	Crowd-sourced / commercial map data	Official Saudi Post national registry
Customer input	Drag a pin, hope it's right	Type an 8-character Short Address they already know
Verification	None — accepted as entered	Validated against SPL's live database before order is placed

NOT AN EITHER/OR

We are not proposing to rip out femi9's existing map-based address flow. SPL National Address is layered in as the primary, verified path, with the current pin-drop kept as a fallback for the small number of customers without a registered address yet — see Section 5 for the exact flow.

3

SECTION 3

Live Walkthrough — What's Already on femi9.com

We didn't stop at reading about femi9's checkout — we walked through it ourselves, live, as a real customer would. Below is the actual shipping step at femi9.com/en/checkout/#shipping, captured during our review.

femi9.com/en/checkout/#shipping

1 Where you want us to deliver?

Search address...

Google

Keyboard shortcuts | Map data ©2026 | Terms

2

CONFIRM MY LOCATION

ENTER ADDRESS MANUALLY

Near By/District

National Address Code

1 Google Maps pin-drop. This is the imprecise step we cover in Section 1 — the customer drags a pin, and delivery accuracy depends entirely on how well Google has mapped that specific street.

2 "Near By/District" and "National Address Code" — already on the form. This tells us someone at femi9 already scoped a National Address integration. But right now these are plain, disconnected text boxes: nothing validates them against SPL, nothing auto-fills the address fields, nothing corrects the map pin. A customer can type their real Short Address here today and it changes nothing about how the order is delivered.

WHAT THIS MEANS FOR SCOPE

This isn't a build-from-zero project. femi9 already has the field, in the right place, on the right screen. The work is connecting it to SPL's live API — see the next section for exactly what that looks like.

4

SECTION 4

How WeCare Technology Activates It

No redesign. No new screen. The same "National Address Code" field femi9 already built, made to actually do something the moment SPL is wired in behind it.

TODAY — FIELD EXISTS, DOES NOTHING

National Address Code

No validation. No auto-fill. Order ships on the map pin alone.

WITH SPL CONNECTED

National Address Code

RRRD3005

✓ Verified via SPL National Address

3005 Sulayman Ibn Murad St — Al Arid Dist.
RIYADH 13342 · Additional No. 7221
Map pin auto-corrected to rooftop accuracy.

ILLUSTRATIVE MOCKUP

This panel demonstrates the target behavior using SPL's own documented response format (Section 5). Final field placement and styling will match femi9's exact design during build — we are not proposing to change how the checkout looks, only how this one field behaves.

WHAT CHANGES FOR THE CUSTOMER

- ☒ Types the Short Address they already have (or already got from Absher/Tawakkalna) into a field that already exists on the page today.
- ☒ Sees an instant green confirmation instead of silence — the field finally does something visible.
- ☒ The order that reaches the courier carries a verified building/street/district/postcode — not just a hopeful pin on a map.

5

SECTION 5

How It Plugs Into femi9's Magento 2 Checkout

CONFIRMED BY DIRECT TECHNICAL REVIEW

femi9.com is built on **Magento 2** (confirmed via the checkout page's core Magento markup and `form_key` security token). The checkout already carries **Tamara** for buy-now-pay-later and an **Aheadworks** popup module, alongside a dormant "National Address Code" field (Section 3) and heavy reliance on Google for maps/address lookup. This tells us exactly where the integration needs to sit — inside the existing shipping-address step, reusing the field that's already there, without touching payment or promo logic.

CHECKOUT FLOW

1 Customer enters their SPL Short Address

- The dormant `NationalAddressCode` field (Section 3) becomes live: the customer types their 8-character Short Address (e.g. `RRRD3005`), with the map pin kept as a visible fallback for anyone who doesn't have one yet.

2 Magento calls SPL to verify and expand it

- `FullNABByShortAddress` resolves the Short Address into the full verified address — building number, street, district, city, postcode, additional number — plus exact coordinates.

3 Pin-drop customers get reverse-validated

- If a customer still drops a pin, `FullNationalAddressByGeocode` checks that latitude/longitude against the National Address database and offers the verified address as a one-click confirmation before checkout completes.

4 Verified address travels with the order

- The verified address and precise geocode are saved to the Magento order and passed to the courier — no more guesswork on the last mile. `GeoCodeByShortAddress` and `NationalAddressByShortAddress` support lighter lookups for saved address books and repeat customers.

THE 4 SPL APIS THIS INTEGRATION USES

API & PURPOSE

01 FullNationalAddressByGeocode

Input: latitude/longitude. Output: full verified address + Short Address. Used to validate/enrich a customer's map pin.

02 FullNABByShortAddress

Input: Short Address (e.g. `RRRD3005`). Output: full address + coordinates. The primary lookup used at checkout.

03 NationalAddressByShortAddress

Input: Short Address. Output: lightweight address payload (no coordinates) — used for address-book display and confirmation screens.

04 GeoCodeByShortAddress

Input: Short Address. Output: coordinates only — used to hand off precise pickup/drop coordinates to the courier's routing system.

BUILT-IN SAFETY NET

SPL's own API contract already defines clean success/failure responses with error codes for every edge case (invalid address, quota limits, service downtime). We fall back to femi9's current manual address entry whenever SPL can't resolve a lookup — the new flow can only make checkout more accurate, never block an order.

6

SECTION 6

Delivery Roadmap

PHASE & SCOPE

01 Discovery & SPL Business Registration

FAD registers femi9 for SPL National Address for Business to obtain the production `api_key`. WeCare Technology finalizes the exact checkout customization points alongside Tamara and Aheadworks.

02 Magento Module Build

Custom Magento 2 module: Short Address field on checkout, REST client for the 4 SPL endpoints, admin-configurable API key and sandbox/production toggle.

03 QA Against SPL Responses

Test every documented success and failure case (invalid address, quota limits, service downtime) plus fallback-to-manual-entry behavior.

04 Go-Live & Monitoring

Production rollout on femi9.com, with delivery-accuracy tracking to quantify the reduction in misdelivered orders.

WHAT FAD NEEDS TO PROVIDE

- ☒ **SPL Business National Address registration and API key** — the one dependency outside our control; SPL's registration is free and typically fast for a registered Saudi entity.
- ☒ **Access to femi9's Magento admin / codebase** (or its current agency) so the module can be installed cleanly alongside existing extensions.
- ☒ **A staging environment** to validate the checkout changes before they touch live orders.

OUR CONFIDENCE

"We've already solved this exact problem for Feed and Planet Zero. The femi9 integration is a known playbook, applied to a checkout we've already reviewed and a platform — Magento 2 — we build on daily. We're ready to start as soon as the SPL API key is in hand."
