

Business Requirements for the *Vitality* Mobile App

The full functional scope for Vitality Home Care's member-facing mobile app — booking, wellness tracking, family coordination, and read-only wearable integration — organized by requirement, priority, and release phase.

32 REQUIREMENTS · 5 FUNCTIONAL LAYERS · 3 RELEASE PHASES

Companion-first, Arabic-first, family-inclusive home healthcare

V1.0 → V2.0

IOS & ANDROID

Document Control

ATTRIBUTE	DETAIL
Document Title	Business Requirements Document — Vitality Mobile App
Document ID	VIT-BRD-2026-001
Client	Vitality Home Health Services (Burjeel Arabia Healthcare Network)
Classification	Confidential — for Vitality internal use only
Status	Draft for review — pending stakeholder sign-off

VERSION	DATE	CHANGE SUMMARY
1.0	2026-07-12	Initial BRD compiled from approved product strategy (00–08), experience/feature spec, and confirmed wearable-integration scope

01 Executive Summary	09 FR — Family Layer
02 Purpose & Scope	10 Acceptance Criteria
03 Stakeholders	11 Prioritization (MoSCoW)
04 Business Objectives	12 Release Phasing
05 FR — Core Experience (Booking)	13 Non-Functional Requirements
06 FR — Wellness Experience	14 Assumptions & Risks
07 FR — Emotional Support Layer	15 Glossary
08 FR — Communication Layer	16 Approval & Sign-off

01

SECTION 01

Executive Summary

The business problem, in one paragraph

Vitality Home Health Services has no functioning mobile booking experience today: every "Book Now" on the website exits to a plain WhatsApp chat or an external hospital-intake-style portal (patients.nixpend.com), with no live availability, no confirmation artifact, no payment flow, and no member accounts or history. Meanwhile every GCC digital-health competitor researched — Sehhaty, Sanar, Cura, Thaat, DarDoc, Justlife — competes on transactional breadth, not on being a trusted companion through a recovery journey. This BRD defines the mobile app that closes both gaps at once: a real native booking experience, plus a companion-first wellness layer (narrated scores, session-dot journeys, celebrations, family coordination) that no direct competitor currently offers.

Scope at a glance: 32 functional requirements across 5 layers, 25 of them MUST-have for v1.0, delivered across 3 release phases (v1.0 → v1.5 → v2.0), for iOS and Android, in Arabic (RTL-first) and English.

02

SECTION 02

Purpose & Scope

What this document defines

This BRD defines the complete functional scope of the Vitality member-facing mobile app (iOS + Android), replacing the current experience where every "Book Now" exits to a plain WhatsApp chat or an external hospital-style portal (patients.nixpend.com). It captures 32 requirements across 5 functional layers, each with a unique FR ID, priority (MoSCoW), owning dependency (App-native vs. Nixpend HMS vs. AIWA/AIKA), and target release phase.

In Scope

- Native iOS and Android member-facing app covering booking, wellness tracking, emotional/motivational layer, in-app communication, and family coordination (FR-A1 through FR-E6, 32 requirements total).
- Read-only wearable and health-platform data sync (FR-B9): **Apple Health**, **Samsung Health** (via Google Health Connect), and **WHOOP**.

- Integration contracts with Nixpend HMS (availability, bookings, plans, visit summaries, red-flag routing), AIWA (WhatsApp/chat), and AIKA (voice) at the level of what data crosses each boundary — not their internal implementation.
- Bilingual (Arabic RTL-first / English), prayer-time-aware, and Ramadan-aware behavior as system-wide non-functional requirements.

Out of Scope

- Visual design specification and design tokens — see 08–design–direction.md.
- Screen-by-screen UX flows and interaction detail — see 10–screens.html / 11–experience.html.
- Commercial terms, pricing, and payment schedule — see the separate commercial quotation.
- Nixpend HMS, AIWA, and AIKA internal architecture — owned by their respective system specs, referenced here only at the integration-contract level.
- Computer-vision exercise feedback, telehealth video consults, pharmacy/marketplace breadth, wearable write-back, fall-detection escalation, and community features — explicitly deferred, see Section 11 (WON'T).

03

SECTION 03
Stakeholders

Roles & responsibilities

ROLE	RESPONSIBILITY ON THIS PROJECT
Executive Sponsor (Vitality)	Final scope and budget authority; resolves escalations between phases
Product Owner (Vitality)	Owens this BRD's accuracy; approves scope changes and re-prioritization
Medical Director (Vitality)	Clinical sign-off on wellness-score logic, red-flag routing thresholds, and any wearable-derived guidance (FR-B9 guardrails)
Nixpend HMS Owner (Vitality)	Confirms and maintains the API contract this BRD assumes (availability, booking, plan, visit-summary, red-flag endpoints, payment processing)
Delivery Team	Design, build, integration, and testing of all in-scope requirements
QA / Acceptance Owner	Verifies each FR against its acceptance criteria (Section 10) before release sign-off

04

SECTION 04
Business Objectives

Why this app is being built

- **Close the digital gap.** A full bilingual 4-step booking wizard already exists in the website's codebase but was never shipped as real UI. No live availability, no confirmation artifact, no payment flow, no accounts/history exist today.
- **Own the empty "companion" quadrant.** Sehhaty, Sanar, Cura, Thaat, DarDoc, and Justlife all sit in the transactional half of the market. No GCC competitor combines clinical credibility with a wellness-grade, companion-first experience.
- **Make recovery visible.** Session-dot journeys, narrated wellness scores, and outcome-evidence charts turn a service grid into a journey with a visible ending.

- **Support the family, not just the patient.** The Family Care Circle lets one account (e.g. Noura) coordinate care for a dependent, with patient-controlled, per-datatype privacy.
- **Arabic-first, not Arabic-translated.** RTL-first design, gender-guaranteed caregiver matching, prayer-time-aware scheduling, and Ramadan mode are infrastructure, not add-ons.

05

SECTION 05

FR-A — Core Experience: Booking & Transactions (7 requirements)

FR-A1 · Native 4-Step Booking Wizard

Select Service → Date & Time (real Nixpend availability, prayer-time-aware slots) → Your Details → Payment → confirmation artifact with booking reference, caregiver card, calendar add, reminder cadence.

MUST

FR-A2 · Package & Program Booking

Flagship programs (Post-Surgery Recovery, Home Care Plus, Diabetes Care) bookable as multi-session journeys with a session-dot journey instantiated on confirmation.

MUST

FR-A3 · Home Physio Booking with Therapist Matching

Gender preference first (guaranteed forever), language, specialty, style → theatrical matching wait → Match Reveal: named human, photo, credentials, intro video.

MUST

FR-A4 · Home Visit Scheduling with District Coverage

Riyadh district picker, coverage-aware slotting, saved addresses with home-entry notes, household protocol capture (mahram flags).

MUST

FR-A5 · 2-Tap Rebooking & Favorites ("My Usual")

Post-visit card — "Book Amal again, same time next week?" Saved rituals extend to family dependents.

MUST

FR-A6 · Payments & Insurance

Mada + Apple Pay mandatory, Tabby/Tamara installments, STC Pay fast-follow, insurance capture (Bupa, Tawuniya, MedGulf, Al-Rajhi Takaful, AXA), cash-on-visit toggle. Payment processing integration is owned by Nixpend (HMS) — API contract (supported methods, tokenization, refunds, webhook/callback handling) not yet confirmed. See risk below.

MUST (TABBY: SHOULD)

FR-A7 · Member Profile & Care Memory

Deferred-until-booking identity, biometric unlock thereafter, visit history as a warm timeline, returning-member recognition.

MUST

06

SECTION 06

FR-B — Wellness Experience: Plans, Tracking, Progress (9 requirements)

FR-B1 · Daily Recovery Plans

The active care plan rendered as Today's Care Plan cards, sourced from the physio-authored plan in Nixpend, one day at a time. When the therapist updates the clinical plan in Nixpend after a visit (progression, regression, or new exercises), the app's plan refreshes automatically — the therapist's visit notes are the plan's source of truth, not a separate copy the app can drift from.

MUST

FR-B2 · Guided Exercise Player

Video demo (own therapist where possible), Arabic voiceover, guided timer, landscape floor-exercise mode, interruptible 5–10 min chunks, "how did it feel?" adapting the next assignment.

MUST (CV FEEDBACK: WON'T)

FR-B3 · Wellness Tracking — Daily Check-ins

30-second morning ritual: pain, mood, sleep sliders, plus one physio-standard functional question tied to the member's plan (e.g. "could you do today's key movement without stopping?" — a plain-language stand-in for a range-of-motion/functional outcome measure, not a raw clinical scale shown on screen). Feeds the recovery score and the ring; red flags route quietly to the care team via Nixpend/AIWA.

MUST

FR-B4 · Progress Visualization — Ring, Dots, Evidence

Daily progress ring, session-dot journey per plan, outcome evidence charts ("pain down 40% since session 1") reviewed with the caregiver at visits.

MUST

FR-B5 · Narrated Daily Wellness Score

One readiness number computed from check-in inputs (no wearable required), always subordinate to its warm Arabic-first sentence. Never a grade, never alarm-red.

MUST

FR-B6 · Health Check Results, Presented Warmly

Lab results delivered behind a humanized summary layer: "what does this mean and am I okay?" first, detail available for those who want it.

SHOULD

FR-B7 · Wellness Programs as Journeys

Glow, Shape It, and IV-therapy courses rendered as care plans: session dots, milestones, celebrations, maintenance cadence nudges.

SHOULD

FR-B8 · Arabic Wellness Content Shelf

Small curated library, original Arabic first: recovery sleep audio, gentle mobility videos, caregiver-authored tips, Ramadan-aware content.

SHOULD

FR-B9 · Wearable & Health-Platform Sync (read-only)

Connect **Apple Health**, **Samsung Health** (via Google Health Connect), or **WHOOP** — read-only, no write-back. Feeds the existing narrated score, recovery-plan tone, and exercise suggestions, plus new motivation copy calibrated to real activity levels. Mi Health (Xiaomi) unverified — no confirmed public API found; do not commit until checked.

MUST · CONFIRMED 2026-07-12

SECTION 07

07

FR-C — Emotional Support Layer: the Differentiator (5 requirements)

FR-C1 · Encouragement Engine

Context-aware warm-copy system behind all loop messaging: ring closed, streak week, hard day, pre-visit eve, plateau, return-after-absence. Miss-messages meet compassion by contract.

MUST

FR-C2 · Recovery Celebrations

Full-screen gold celebration moments: first session, first week, halfway, ring-close micro-moments, graduation with journey recap. Shareable to the Family Care Circle at the patient's choice.

MUST

FR-C3 · Achievement Milestones

The milestone ladder per plan/program: life-termed names, next-milestone visibility on the home screen, milestone history as the member's story.

MUST

FR-C4 · Care Companion Presence

The ambient layer that makes the app feel inhabited: time-aware greetings, caregiver-forward header, prayer-quiet defaults, Ramadan mode, returning-member welcome.

MUST

FR-C5 · Post-Visit Caregiver Notes

Warm plain-language summary after each visit — what we did, how you're doing, what's next — plus the caregiver's personal note. Major milestones upgrade to voice/video notes.

MUST (VOICE NOTES: SHOULD)

SECTION 08

08

FR-D — Communication Layer: One Care Brain, Three Doors (5 requirements)

FR-D1 · Care Thread

Always-open persistent chat with the caregiver/care team: photos, "is this normal?" questions, voice notes. AIWA powers first-line responses with honest human escalation.

MUST

FR-D2 · Voice Support (AIKA)

One-tap call surface: AIKA answers as Vitality, handles booking status, rescheduling, prep questions, escalates warmly to the hotline/coordinators.

SHOULD (CALL BUTTON: MUST)

FR-D3 · Follow-up Reminders

Care-only reminder system: T-24h visit reminder with caregiver face + prep checklist, exercise nudges, medication cadence, post-visit follow-ups. Marketing is contractually banned from push.

MUST

FR-D4 · Appointment Assistance

Reschedule/cancel with grace, running visit status, coordinator escalation for complex cases — the app + AIWA/AIKA absorbing routine work.

MUST

FR-D5 · Prayer-Time-Aware Notifications

System-wide notification governor: no pushes across the five prayer windows, Friday-family-day awareness, Ramadan-shifted schedules, member-tunable quiet hours.

MUST

SECTION 09

09

FR-E — Family Layer: the Family Care Circle (6 requirements)

FR-E1 · Circle Invite Flow

One account invites family into a dependent's circle: WhatsApp-native invite, role assignment (coordinator, viewer), zero education cost via the Sehhaty/Tawakkalna mental model.

MUST

FR-E2 · Family Dashboard

The dependent's week at a glance: visits confirmed/done, ring days closed, latest caregiver note, next appointment — one Thursday-evening glance replacing three WhatsApp threads.

MUST

FR-E3 · Care Updates & Shared Progress

Push channel for the circle: visit-completed notes, milestone celebrations, en-route forwarding on visit days, weekly recap. Good news by default, never surveillance.

MUST

FR-E4 · Patient-Controlled Privacy (Per Data Type)

The patient controls sharing per data type: mobility progress shared, mood check-ins private, visit confirmations circle-wide — with conservative defaults.

MUST

FR-E5 · Booking-on-Behalf

Book, pay, renew, and manage for a dependent from one's own phone — proxy intake, saved entry notes, female-caregiver guarantee locked in and remembered forever.

MUST

FR-E6 · Shareable Celebration Moments

Milestone celebrations exportable as elegant, on-brand cards to the family circle and (patient's choice) beyond — the referral surface that never feels like marketing.

SHOULD

How "done" is verified for the highest-risk requirements

Every MUST-have requirement needs a testable acceptance criterion before QA sign-off. The table below covers the requirements with the most ambiguity risk; remaining MUST items follow the same pattern at build time.

CRITERION	REQUIREMENT	ACCEPTANCE CRITERIA
AC-01	FR-A1 Booking Wizard	A member can complete Select Service → Date/Time → Details → Payment and receive a confirmation artifact (booking reference, caregiver card, calendar add) in under 4 taps beyond required data entry, using live Nixpend availability, with prayer-time windows excluded from bookable slots.
AC-02	FR-A3 Therapist Matching	Gender preference captured once is never asked again for that member across all future bookings; the Match Reveal screen displays a named caregiver with photo, credentials, and MOH license badge before any booking is finalized.
AC-03	FR-B3 Daily Check-ins	A check-in (pain/mood/sleep sliders) completes in ≤30 seconds; any red-flag threshold breach triggers a Nixpend/AIWA routing event within 5 minutes without surfacing an alarming UI state to the member.
AC-04	FR-B5 Narrated Wellness Score	The score is never displayed without its accompanying Arabic-first narrated sentence; no numeric value renders in red or any alarm-associated color under any data condition.
AC-05	FR-B9 Wearable Sync	Connecting Apple Health , Samsung Health , or WHOOP requires no data entry beyond the platform's native permission prompt; disconnecting or leaving a device unworn falls back silently to manual check-in with no reconnect nagging; no raw clinical number or wearable brand name appears on the home screen.
AC-06	FR-D5 Prayer-Time Notifications	Zero push notifications are delivered during any of the five daily prayer windows (Riyadh timings) across a 7-day test window, verified against the published prayer calendar.
AC-07	FR-E4 Per-Data-Type Privacy	A patient can independently toggle sharing for at least 3 distinct data types (e.g. mobility progress, mood check-ins, visit confirmations) to the Family Circle, with defaults matching the conservative baseline defined in FR-E4, verified by inspecting what a linked family member's dashboard actually renders after each toggle change.
AC-08	FR-E5 Booking-on-Behalf	A Circle coordinator (e.g. Noura) can complete a full booking for a dependent from her own authenticated session, with the female-caregiver guarantee and saved entry notes carried over automatically from the dependent's profile.
AC-09	FR-A6 Payments & Insurance	A member can pay via Mada or Apple Pay end-to-end through the Nixpend payment integration without leaving the app; a failed or declined payment returns a clear retry state without losing the in-progress booking; refunds and payment status are reflected in the member's payment history within 24 hours. Blocked pending confirmation of Nixpend's payment API contract — see risk below.
AC-10	FR-B3 Functional Check-in	The daily check-in includes one plan-linked functional question in plain language (never a numeric ROM/clinical scale shown to the member); a declining trend over 3+ consecutive days routes to the care team the same way a pain red-flag does.
AC-11	FR-B1 Plan Sync from Clinical Notes	When a therapist updates the care plan in Nixpend after a visit, the member's Today's Care Plan reflects the change within 1 hour without requiring an app update or manual refresh by the member.

MUST

A1–A7 (Tabby→SHOULD), B1–B5, B9 wearable sync (read-only), C1–C5 (voice notes→SHOULD), D1, D3, D4, D5 (+ D2 call button), E1–E5

25 requirements**SHOULD**

A6–Tabby installments, B6 warm results, B7 wellness journeys, B8 content shelf, C5 caregiver voice notes, D2 AIKA full flows, E6 shareable celebrations

7 requirements**COULD**

Membership tier ladder (A2 extension), STC Pay, CHI insurance linkage, home-screen widgets, weekly "wrapped" recaps

Not counted**WON'T (this horizon)**

Computer-vision exercise feedback (B2), telehealth video consults, pharmacy/marketplace/symptom-checker breadth, wearable write-back / fall-detection / Family Circle escalation (v2+ if ever), community features

Deferred**V1.0****The Companion Arrives**

Core booking (Layer A), daily check-ins and narrated score (B1–B5), read-only wearable sync (B9), the full emotional support layer (C1–C5), care thread and reminders (D1, D3–D5), and the complete Family Care Circle (E1–E5). The feeling is the scope.

V1.5**The Companion Speaks**

AIKA full voice flows (D2), Tabby/Tamara installments, warm health-check results (B6), wellness programs as journeys (B7), the Arabic content shelf (B8), and shareable celebration cards (E6).

V2.0**The Membership**

Membership tier ladder, STC Pay, CHI insurance linkage, home-screen widgets, weekly recaps — and, if re-scoped with the client, wearable write-back, fall-detection escalation, and Family Circle safety alerts.

- **NFR-01 Bilingual, RTL-first.** Every screen designed RTL-first with English as the faithful mirror; warm MSA copy localized to English, not the reverse.
- **NFR-02 Data residency & compliance.** Health data is Sensitive/Tier-4 under Saudi PDPL (SDAIA). Cross-border transfer (relevant to **WHOOP**/Mi Health cloud APIs) needs contractual safeguards, not an assumption — formal legal review required before committing to any cloud-based wearable pipeline.
- **NFR-03 Prayer-time and cultural awareness as infrastructure.** No pushes across the five daily prayer windows, Ramadan-shifted schedules, Friday-family-day awareness — on by default, not configurable per feature.
- **NFR-04 Privacy by design.** Per-datatype consent model (FR-E4) applies system-wide, including any future wearable data — conservative defaults, plain-language sharing summaries.
- **NFR-05 Performance & pacing.** Matching wait screen minimum 2400ms (theatrical, even if backend is instant) — deliberate pacing is a UX requirement, not a performance gap.
- **NFR-06 Integration boundary.** Nixpend HMS is system of record for availability, bookings, and clinical facts; the app never becomes a second source of truth for clinical data.

- **NFR-07 Availability.** Booking and check-in flows must degrade gracefully (cached last-known state, clear retry messaging) during any Nixpend API outage — never a blank or crashed screen.
- **NFR-08 Accessibility.** Minimum WCAG 2.1 AA contrast and type-size floor across both language directions, consistent with the "premium, not just pretty" brand requirement.
- **NFR-09 Security.** Biometric unlock for returning members after deferred-until-booking identity; step-up authentication required specifically for payment and medical-record actions.

14

SECTION 14

Assumptions & Risks

Assumption: Nixpend HMS exposes the read/write APIs this BRD assumes (availability read, booking write, plan read, visit summary, red-flag write). Confirm API contract with Nixpend before Layer A/B implementation begins.

Risk (open, needs verification): Payment processing for FR-A6 (Mada, Apple Pay, Tabby/Tamara, STC Pay, cash-on-visit) is owned by **Nixpend**, not built directly into the app. Nixpend's payment API contract — supported methods, tokenization/PCI scope, refund flow, webhook/callback handling, and settlement reporting — has not yet been confirmed. This must be checked with Nixpend before FR-A6 implementation begins; it directly affects checkout UX and go-live timeline.

Risk: Mi Health (Xiaomi) has no confirmed public third-party API. If unavailable, B9 ships with **Apple Health**, **Samsung Health**/Health Connect, and **WHOOP** only — do not commit Mi Health to the client until verified.

Risk: Garmin Connect and **Samsung Health**'s own Partner Apps Program were reportedly not accepting new applicants as of last check (unconfirmed beyond forum signals) — verify directly with each vendor before relying on this for B9 beyond the Health Connect route.

Assumption: "Companion quadrant is empty in the GCC" remains true at launch. Sehhaty (HealthKit/CareKit steps sync) and the Sehhaty×**WHOOP** national-platform partnership exist but are narrower than Vitality's proposed depth — re-verify competitive claims before final go-to-market copy.

TERM	DEFINITION
Nixpend	Vitality's Home Management System (HMS) — system of record for therapist availability, bookings, care plans, and visit facts.
AIWA	The AI WhatsApp/chat agent handling first-line member conversation with human escalation.
AIKA	The AI voice agent answering calls as Vitality on the SIP trunk.
Family Care Circle	The account structure letting one member (e.g. a coordinating daughter) manage care for a linked dependent, with per-datatype privacy controls.
Narrated Wellness Score	A single readiness number computed from check-in inputs, always paired with an interpretive sentence and never shown as a bare number or alarm color.
Match Reveal	The onboarding screen presenting the assigned caregiver (photo, credentials, MOH license, intro video) as the app's first emotional peak.
Health Connect	Google's on-device health-data API on Android; Samsung Health has synced into it since October 2022, so Health Connect integration covers most Samsung Health data without a separate SDK.
HealthKit	Apple's on-device health-data framework on iOS; the basis for FR-B9's Apple Health integration.
MoSCoW	Prioritization framework: Must have, Should have, Could have, Won't have (this horizon).
PDPL	Saudi Personal Data Protection Law, enforced by SDAIA; governs handling of Sensitive/Tier-4 data including health data.

SCOPE SUMMARY

Total requirements	32
MUST (v1.0 core)	25
SHOULD (v1.5)	7
Functional layers	5 (Core, Wellness, Emotional, Communication, Family)
Release phases	3 (v1.0, v1.5, v2.0)

PLATFORMS

iOS + Android

ARABIC (RTL) + ENGLISH

This BRD is considered approved for build once the roles below confirm the scope, priorities, and phasing above reflect agreed requirements. Any change after sign-off follows the standard change-request process, not a silent edit to this document.
